

HSU PEN INTERNATIONAL
PRECISION MACHINERY

CNC ROTARY TABLE

AN EXPERT IN ROTARY TABLE

HIGH PRECISION • HIGH RIGIDITY •
HIGH STABILITY

**1963 COMPANY
ESTABLISHED
JIN FENG INDUSTRIAL
COMPANY**

HSU PEN International Precision Machinery Co., Ltd. was established in 1963 by the former president, C. Y. Chang. The original company name was "Jin Feng Industrial Company". At the beginning stage, the company specialized in the manufacture of household rice milling machine. C. Y. Chang was dedicated to upgrading technology and entered into the production of paper-making machinery to meet the Taiwan's economic trend, including the copper rollers of pulp grinding machine and paper making machine with 50% of market share.

**since
1963**

**1976 COMPANY RECONSTRUCTED AS
HSU PEN MACHINERY INDUSTRIAL CO., LTD.**

HSU PEN began exporting rice milling machines to worldwide market, including South-east Asia, Central and South America and Africa. Meantime, HSU PEN entered into the manufacturing of machine tool (turret type milling machine). Additionally, with the prosperous growth of the shoes industry in Taiwan, HSU PEN has also stepped into the production of shoes making machines with 50 years of history up to now in this sector.

**1988 PRESENTED CARBON FIBER
PRODUCTION EQUIPMENT**

HSU PEN set up an independent carbon fiber technical team for developing the first unit of Double Roller Weaving Machine for serving the Taiwan's composite material industry. This machine is designed for production of tennis racket, badminton racket, carbon fiber frame of bicycle and related products. Currently HSU PEN is the largest manufacturer in Taiwan for immersed type carbon fiber double roller weaving machine and special purpose machines for carbon fiber products.

**1995 LAUNCHED INTO PRODUCTION OF
WOODWORKING MACHINERY**

With an aim to meet the market trend and the flourish of the furniture industry, HSU PEN launched into production of traditional tenon jointer, dovetail tenon & mortise jointer, rectangular tenon jointer and rectangular mortise jointer. The quality of each series of machine has reached the international level.

CNC ROTARY TABLE

Outstanding R&D Team

At HSU PEN, we have an outstanding R&D team who constantly developed various new products. Moreover, with our concepts of customer priority, quality assurance, specialized manufacturing as well as rigorous quality control, we are confident that each product from HSU PEN will fully meet customers' requirements.

Global Sales Network

HSU PEN not only spends great efforts in presenting a wide range of CNC rotary tables, but also offers customers various woodworking machines, such as CNC Tenon Jointer, Continuous Dovetail Tenon & Mortise Jointer, Rectangular-tenon Jointer. Besides, we also produce carbon fiber immersing machine applied for production of carbon fiber tennis racket, carbon fiber bicycle frame and related composite material and carbon fiber products. HSU PEN products have been sold to a wide range of countries, such as U.S.A., Mexico, Italy, Spain, Egypt, China, Korea, Singapore, Malaysia, Indonesia, Vietnam, Burma, India, Iran and Pakistan, etc.

Versatile Product Strategy

With our outstanding R&D capabilities combined with versatile technical background and rigorous quality control, we always strive hard for establishing a world-dependable brand name.

HSU PEN's versatile technical departments include:

- CNC rotary table department
- Special purpose machines for carbon fiber department
- Woodworking machinery department

2001 PRODUCTION OF CNC WOODWORKING EQUIPMENT

With the trend of the times and the traditional machinery production is in short supply, HSU PEN has been dedicated to develop the CNC tenon jointer and CNC tenon/ mortise complex machine. In 2006, Hsu Pen developed the first CNC double ends rectangular tenon jointer in Taiwan which has been widely recognized by customers.

2010 DESIGN AND MANUFACTURING OF CNC ROTARY TABLE

Under the leadership of General Manager, S. J. Chang, HSU PEN set up a R&D center for the development of CNC rotary table. Based on the years of understanding and technical experience in the field of rotary table in combination with heavy investment of capital and efforts, HSU PEN has dedicated to the development of rotary table. Currently, in addition to the existing 4th axis rotary tables, HSU PEN also aggressively develop the 5th rotary tables and special models. With their outstanding accuracy and structural rigidity, HSU PEN products have been fully recognized by all customers.

2015 STEADY PLAY. INSISTING ON QUALITY.

HSU PEN has been established for about 5 years, and has always insisted on quality, performance and dependability of accuracy. HSU PEN has received wide response from the users. HSU PEN 5-axis rotary table has reached a mature condition and machining accuracy fully meet customers' requirements. HSU PEN brand name is designated by some customers and recognized by customers.

Precision Parts Machining Assures High Accuracy of Rotary Table

The parts of HSU PEN rotary table are precision machined by using the sophisticated machine tools. For example : the body of rotary table is machined by Japanese Mazak horizontal machining center. Therefore, the accuracy of HSU PEN rotary table will fully meet customer's requirement.

Rigorous Quality Inspection

Insisting on quality is HSU PEN's unwavering concept. At Hsu Pen, we are committed to offer the best quality of rotary table. Rigorous quality control is conducted throughout the entire manufacturing process from parts machining, assembling to finished product test, etc. Our objective is to reduce quality defect to a minimum. In addition, our quality control department applies the advanced laser instrument to inspect the indexing accuracy of rotary table.

Renishaw laser instrument is applied for inspecting indexing accuracy.

Two-dimensional measuring device

Japanese Made Worm/Worm Gear (Optional)

04

High Positioning Accuracy !

Long Service Life !

HSU PEN employs Japan-imported worm/ worm gear, featuring high precision, maximum wear-resistance and long service life.

Material:

WORM GEAR: High tensile strength aluminum bronze alloy (ALBC3)

WORM: Nickel Chrome Molybdenum alloy steel (SNCM21), normalized and carburized to HRC $60^\circ \pm 1^\circ$.

Features:

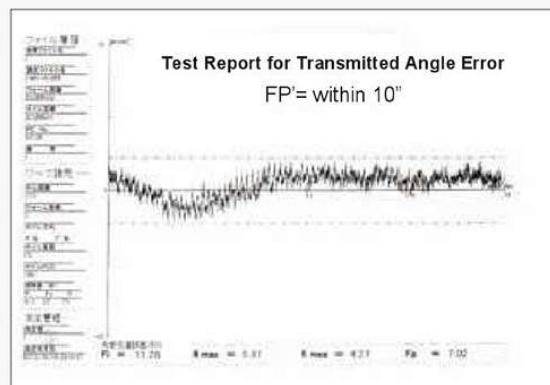

Maximum stability and wear resistance. Increased tooth depth and contact surface strength of worm gear. Double lead worm shaft features small adjustment backlash, high torque and big contact surface.

Easy To Adjust Backlash

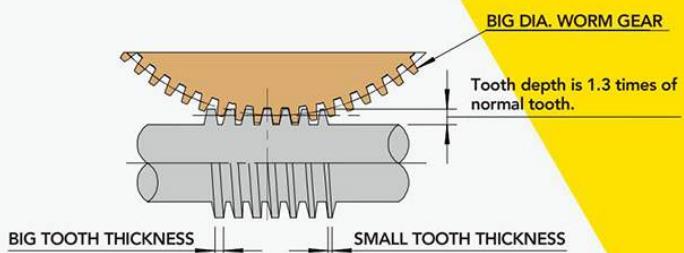

After the worm/worm gear set has been operated for a long time, excessive backlash between both may occur. It may affect the positioning accuracy of the rotary table. When this occurs, simply adjust the worm for reducing backlash, then the rotary table will return to its normal positioning accuracy.

- This combination features less friction coefficient and higher transmission efficiency.
- Matching surface up to 35%~45% resists heavy cutting and is suitable for continuous machining.
- Stable accuracy can be maintained for a long time.

Accuracy Test Report For
Japan-imported Worm / Worm Gear

Bearing Used on Standard Models

Rigidity is 2~3 times greater than that of conventional bearings

YRT Extra Large Radial / Axial Bearing

In order to meet the international trend, HSU PEN rotary table is fitted with extra large radial / axial bearing (Germany technology), featuring large diameter of rotating way, heavy load resistance and uniform heat transfer. Another benefits include minimum wear, long service life, high rigidity, high precision and vibration resistance. Lifetime stable accuracy and accurate rotation fully meet the requirement of high positioning accuracy. With outstanding load resisting capability in radial and axial directions, the bearing is able to withstand vibrating impact from any direction and allowing the impact to be perpendicular to one roller surface. As a result, the rotary table can achieve better stability and higher rigidity, while reducing deformation to a minimum.

Figure of Hydraulic Brake Structure

For models over 255 hydraulic brake series, the rotary tables employ large radial / axial bearing and the spindle features large indise hole. In order to ensure concentricity, the braking surface and the bearing connecting surface are ground concentrically. The use of large bearing in combination with the increased wall thickness, which leads to an increase of loading rigidity. The brake disk employs circumference brake, which has been precision ground with high concentricity. No runout will occur when braking. The worm / worm gear are manufactured from wear-resistant material combined with increased teeth size to increase contact surfaces. This results in greater torque, stronger structure and hard to deform for loading with a heavy workpiece.

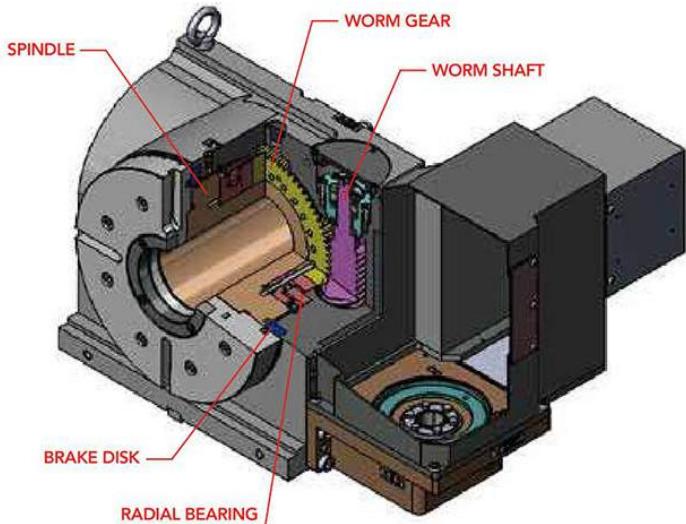

Figure of Pneumatic Brake Structure

Features:

The pneumatically operated products employ multi-piece disk brake and the brake surface of the piston is designed at the biggest diameter position. This means the bigger brake surface diameter, the more powerful braking force. These combined with highly rigid body structure to fully eliminate table surface floating problem during braking. Also, braking torque is 2 times of competitive models.

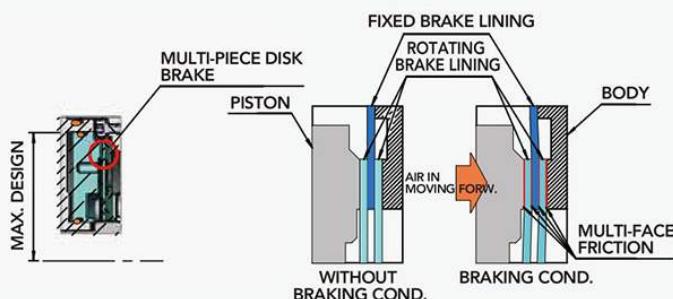

Figure of Hydraulic Circumference Structure

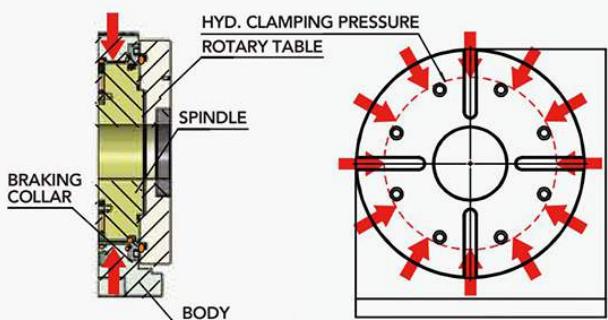

Full Circumference Brake No Runout. No Displacement

By applying the hydraulic power to clamp the entire circumference, the table runout problem can be avoided.

Unlike the conventional disk brake, the full circumference brake provides greater clamping force and no vibration, ensuring high machining accuracy of the machine.

Features:

The closer the brake disk actuating point, the more stability and the greater clamping force. The body structure is rigid and stable and holds the spindle from circumference when braking, which makes the table runout free. It provides two more times of braking torque than competitive models. The circumference is enclosed, that prevents chips and cutting fluid from permeating into the body.

CNC ROTARY TABLE Pneumatic Brake

- Table diameter provides a choice of Ø125, Ø170, Ø210 and Ø250mm.
- Employs high rigidity, extra large radial and axial bearing.
- Upon request, models with table diameter of Ø170, Ø210 and Ø250mm can be equipped with Japanese made worm/worm gear.
- Equipped with special labyrinth type multi-piece disk brake that provides multi-surface braking. Big area design effectively increases clamping force. The table structure eliminates table surface floating problem.
- Big hole design makes machining more convenient. Manufactured from high quality, durable cast iron. Increased body thickness increases load resistance capability. Large through-hole diameter. High strength, heavy cutting resistance as well as high precision.
- Upon request, models with table diameter of Ø170, Ø210 and Ø250mm are available with hydraulic brake.
- Various sheet metal guards are available to suit various brands of motors. Contact us for detail.

CNC ROTARY TABLE 2/3 Units with Pneumatic Brake

- Table diameter provides a choice of Ø125, Ø170, Ø210 and Ø250mm.
- Employs high rigidity, extra large radial and axial bearing.
- Upon request, models with table diameter of Ø170, Ø210 and Ø250mm can be equipped with Japanese made worm/worm gear.
- Equipped with special labyrinth type multi-piece disk brake that provides multi-surface braking. Big area design effectively increases clamping force. The table structure eliminates table surface floating problem.
- Big hole design makes machining more convenient. Manufactured from high quality, durable cast iron. Increased body thickness increases load resistance capability. Large through-hole diameter. High strength, heavy cutting resistance as well as high precision.
- Upon request, models with table diameter of Ø170, Ø210 and Ø250mm are available with hydraulic brake.
- Various sheet metal guards are available to suit various brands of motors. Contact us for detail.

The technical drawing illustrates two views of a machine base. The top view shows a rectangular frame with various internal components and features a central circular feature labeled $\phi 400$. Dimensions include 240 on the left, 906.5 at the top, and 225 and 681.5 on the right. Below the top view, the text "T-Slot Sizes" is followed by a list of values: 225, 681.5, 210, 255, 18h7, and 471.5. The bottom view provides a detailed look at the base's structure, featuring a central circular hub with multiple holes and a flange. Dimensions 200 and 210 are shown on the left, and 3 is shown at the bottom left. A vertical dimension of 18h7 is located at the bottom center.

SINGLE ARM 5-AXIS TILTING SWIVELING ROTARY TABLE

Tilting Axis: Hydraulic Brake

Swiveling Axis: Pneumatic Brake (Upon customer req.)

- Ø170mm table diameter.
- Employs high rigidity, extra large radial and axial bearing.
- The tilting axis employs the latest full circumference brake, featuring even braking force without runout. Maximum clamping area, higher clamping force, no vibration and no braking delay is required. High torque combined with compact, rigid and enclosed structure ensure high cutting quality.
- Please provide the motor appearance information according to the motor brand, which will facilitate design and planning. For details contact us.

CTH series

4½-AXIS ROTARY TABLE

Tilting Axis: Manual
Swiveling Axis: Hydraulic Brake

- Ø255mm table diameter.
 - Employs high rigidity, extra large radial and axial bearing.
 - Upon request, Japanese made worm/worm gear are available.
 - Various sheet metal guards are available to suit various models of motors. Contact us for detail.
 - Angle is set manually through a worm/ worm gear mechanism, which increases tilting strength and helps to support the weight of the rotary table.

FEH series

5-AXIS TILTING SWIVELING ROTARY TABLE

Hydraulic Brake (Tilting Axis)
Pneumatic Brake (Swiveling Axis)

Models over 255 are designed with
hydraulic brake on two axes.

- Table diameter provides a choice of Ø125, Ø170, Ø210, Ø255, Ø320 and Ø400mm.
- Employs high rigidity, extra large radial and axial bearing.
- Upon customer request, models with Ø170, Ø210, Ø250 can be equipped with Japanese made worm / worm gear.
- For models over 255, the tilting axis employs the latest full circumference brake, featuring even braking force without runout. Maximum clamping area, higher clamping force, no vibration and no braking delay is required. High torque combined with compact, rigid and enclosed structure ensure high cutting quality.
- For models over 170, all support units employ the full circumference brake and large hole Japanese-made roller bearing.

STH series SWIVELING SPINDLE HEAD

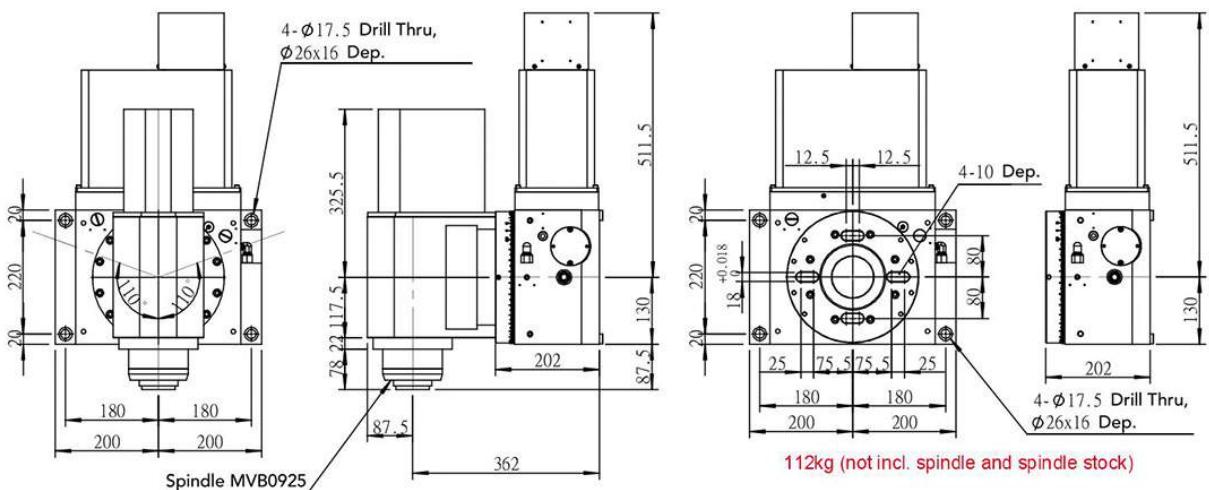

Hydraulic Full Circumference Brake

- Employs high rigidity, extra large radial and axial bearing.
- The spindle head employs the latest full circumference brake, featuring even braking force without runout. Maximum clamping area, higher clamping force, no vibration and no braking delay is required. High torque combined with compact, rigid and enclosed structure ensure high cutting quality.
- High quality cast iron with maximum durability of material, increased wall thickness of body to increase the structural strength. One-piece thru-hole spindle integrates features of high strength, heavy cutting resistance and high machining accuracy.
- Various sheet metal guards are available to suit various brands of motors. Contact us for detail.

CNC SPINDLE HEAD

Hydraulic Full Circumference Brake

- Employs highly rigid radial bearing.
- The spindle head employs the latest full circumference brake, featuring even braking force without runout. Maximum clamping area, higher clamping force, no vibration and no braking delay is required. High torque combined with compact, rigid and enclosed structure ensure high cutting quality.
- The body is manufactured from rigid aluminum with high durability of material and heavy load resistance.
- The spindle head is excellent for machining aluminum molds and special angle drilling.
- For details of various motor brands, contact the manufacturer.
